

OAuth verification for Case Changer

Google classes `script.container.ui` (the menu-and-sidebar permission) as a sensitive scope, so the app must pass OAuth verification before the Marketplace listing can be approved. Everything below is what the Verification Center asks for.

Already in place (4 September 2026)

- Homepage: <https://workingwithkwan.github.io/case-changer/> (verified in Search Console)
- Privacy policy: <https://workingwithkwan.github.io/case-changer/privacy-policy.html>
- Terms: <https://workingwithkwan.github.io/case-changer/terms-of-service.html>
- Authorised domain: workingwithkwan.github.io
- Scopes on the consent screen: `documents.currentonly`, `script.container.ui`

Still needed from Ikhwan

1. Click **Publish app** on the consent screen's Audience page (Cloud console > Google Auth Platform > Audience).
2. Record a short demo video and upload it to YouTube as **Unlisted**. Script below.
3. Open **Verification Center**, click **Prepare for verification**, paste the video link and the justifications below, and submit.

Demo video script (about 60 to 90 seconds)

Record the whole screen with QuickTime (File > New Screen Recording) at English UI language.

1. Show the Cloud console OAuth consent screen's **Branding** page for a moment so the app name "Case Changer" and project are visible.
2. Open a Google Doc that has a couple of sentences of text.
3. Go to **Extensions > Case Changer > UPPERCASE** with nothing authorised yet. The "Authorization required" dialog appears. Click **Continue**.
4. In the Google sign-in popup, pick the account, and pause on the consent screen so the two permissions are readable. Click **Allow**.
5. Select a sentence and run **Extensions > Case Changer > Title Case**. Show the text changing.
6. Open **Extensions > Case Changer > Open sidebar** and click **Sentence case** so the sidebar is shown in use.
7. End on the document with the changed text.

Say nothing or narrate briefly. No editing needed.

Scope justifications (paste into the form)

<https://www.googleapis.com/auth/documents.currentonly> Case Changer reads the text the user

has selected in the currently open Google Doc and writes the same text back with its letter case changed (for example UPPERCASE, Title Case, Sentence case). It only touches the document the add-on is running in. No document content is stored or transmitted anywhere.

<https://www.googleapis.com/auth/script.container.ui> Needed to add the "Case Changer" menu under Extensions and to show the sidebar with one button per case style. This is the only way an Editor add-on can present a menu or sidebar inside Google Docs.

Application description for the form

Case Changer is a free Google Docs add-on that changes the case of selected text (UPPERCASE, lowercase, Sentence case, Title Case, Capitalize Each Word, iNVERSE cASE, aLtErNaTiNg cAsE) while keeping bold, links, colours and other formatting in place. It processes text inside Google's Apps Script platform and stores nothing.

After verification is granted

Cloud console > Marketplace SDK > Store Listing > **Submit for review**. Google's Marketplace team reviews public listings, usually within a few days.
